			χ.				

Continuation of 5. does NOT place the application in condition for allowance because: The Applicant argues that Chou et al. does not teach feedback path in a "polarization controller". The Examiner disagrees. The delay controller of Chou et al. is equivalent to the APC of the claims. The delay controller changes the relative delay between the two principal states of polarization and produces an optical signal exhibiting a predetermined state of polarization. As illustrated in FIG. 1, Chou et al. teaches to use a feedback configuration consisting of delay module 170, polarimeter 210 and control circuit 220. Chou et al. recites in claim 3 and claim 6 that the delay controller is a feedback configuration.
